HaCaT   Tour

01-Dec-2015 1:34 PM

The input query was matched against 476,251 signatures derived from 1,328,098 experiments (Database version A2, release May 04 2014).

The results are shown in two formats:

1. A summary report listing perturbagens ranked by the strength and consistency of their connectivity to the input query, aggregated across cell types and experimental conditions.
2. A detailed view comprising the full list of connectivity scores between the input query and 476,251 signatures.

Help on interpreting these results is available in the lincscloud knowledge base (http://support.lincscloud.org/hc/en-us/articles/202231633-Query-App-Results).
